

INNOVATION NO. 70

CLIENT: Fujitsu Technology Solutions

PROJECT: IoT app development for the workplace of tomorrow: Smart Desk

- Together with Fujitsu, jambit developed the „Smart Desk“ app and created a solution for networking IoT devices in the office.
- Using the minimum viable product approach and a user study, jambit validated the presumed needs and goals at an early stage and developed an optimal solution for Fujitsu.
- jambit provided a cross-functional team of scrum masters, software architects, UI/UX designers and user research experts for the task.
- Open APIs were used, for example with the light source's Bluetooth low-energy API.
- Technologies and methods: C# UWP (Universal Windows Platform), C/C++, BLE (Bluetooth Low Energy), User Centered Design and MVP.

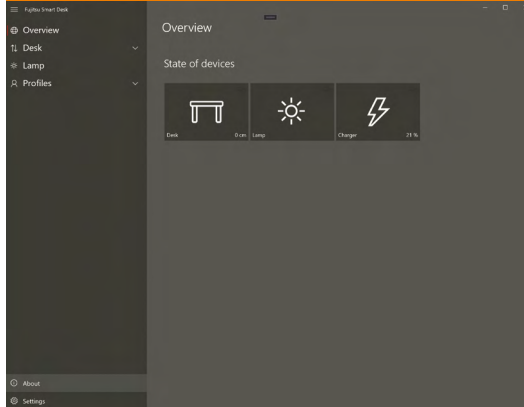

SUCCESS:

- On-time development of an IoT application using the MVP method
- User-centered design based on a professional user study
- On-time delivery of an application despite unforeseen circumstances
- Customer-oriented introduction of agile working methods (Kanban)
- Optimized use of Bluetooth protocols for faster device responsiveness
- Successful interface connection to most of the current office desk suppliers
